

Lucid Voice

Speak again — in your own voice.

On-device AAC that turns 2-3 tapped words into a full, situationally-correct sentence — spoken in a cloned version of the user's own voice.

On-device & private

Your cloned voice

Personal-memory layer

THE LEAP

Tap two words. Speak a whole sentence — in their own voice.

~8 wpm on a tap-board today → ~150 wpm of ordinary speech

She taps

cold

window

“Could you close the window? I’m getting cold.”

● SPOKEN IN HER OWN VOICE

THE THESIS — AND THE MOAT

The same input → a *different, correctly-registered* reply, depending on *who is listening*.

tired • maybe

TO SOFIA (DAUGHTER)

“I’d love to, sweetie, but I’ve been so tired. Can I tell you Saturday?”

tired • maybe

TO MATEO (GRANDSON)

“I’m a little tired right now, mijo. Maybe after my nap? I love you.”

The moat: a personal-memory layer + on-device privacy + your own preserved voice — not the text generation, which any LLM can do.

NOT A BLACK BOX

Watch your memory fire.

Every reply is grounded in your personal knowledge graph — and the exact memories that shaped it light up, live. This is a real screen, not a mockup.

- **Build your brain** — a warm AI interviews you, and each answer blooms a new memory onto the graph.

ON-DEVICE, AND RUNNING TODAY

Private by design — demo-safe by the very same property.

● RUNS LOCALLY

- Personal knowledge graph + retrieval
- Local LLM · Whisper STT · XTTS voice clone
- Airplane-mode capable — no Wi-Fi needed

● OPT-IN CLOUD — SPONSORS

- ElevenLabs — premium voice cloning / TTS
- Deepgram — fast partner speech-to-text
- Claude — the reconstruction reasoning

Now — let's show you live.
